

SOLANDER TRAIL SUMMER WALKABOUT KWG

Although the peak flowering period for native plants is in late winter and spring some plants are in flower in mid-summer. Shown below are a few you might see as you walk around the Solander Trail in FEBRUARY. This trail is an easy walk – about 2.5 kms long on a wide, sealed track and with no steps. If you walk the trail in an anti-clockwise direction the sealed track breaks into two branches after about 250 metres but these branches come together again after a further 250 metres. The left-hand branch takes you past the Knoll Garden (a ‘showcase’ garden for native plants) and Lambert’s Clearing (where wallabies are likely to be seen). Further on, at the lowest point of the trail (Endlicher Point), the track turns and climbs back uphill towards the entrance to Ku-ring-gai Wildflower Garden. For further details of plants in the Garden and Australian Plant Society programs (including ‘Walks & Talks’ starting in March) see the Blandfordia website <https://austplants.com.au/North-Shore/>

Take this sheet with you and see if you can find these plants.
